Target Business Case Study Report

E-Commerce Data Analysis using Google BigQuery
Prepared by: Ritesh Yadav

Executive Summary

This report analyzes Target's Brazil e-commerce dataset using SQL in Google BigQuery. It evaluates customer reach, order growth, seasonality, regional demand, revenue trends, freight costs, delivery efficiency, and payment behavior.

Section A – Initial Exploration

Validated schema, order timeline, geographic coverage, row counts, missing deliveries, and uniqueness of order IDs.

Section B – In-depth Exploration

Analyzed yearly growth, monthly seasonality, and time-of-day ordering behavior.

Section C – Evolution of E-commerce

Studied state-wise monthly orders and customer distribution across Brazil.

Section D – Impact on Economy

Measured revenue growth, order values, and freight economics by state.

Section E – Sales, Freight & Delivery

Measured delivery speed, freight extremes, and logistics performance.

Section F – Payment Analysis

Evaluated payment methods and installment preferences.

A.Initial Exploration

1. Introduction

Before performing advanced business analysis, it is essential to understand the structure, quality, scale, and coverage of the dataset. This stage focuses on validating metadata, identifying the analysis period, checking customer geographic reach, and ensuring data completeness.

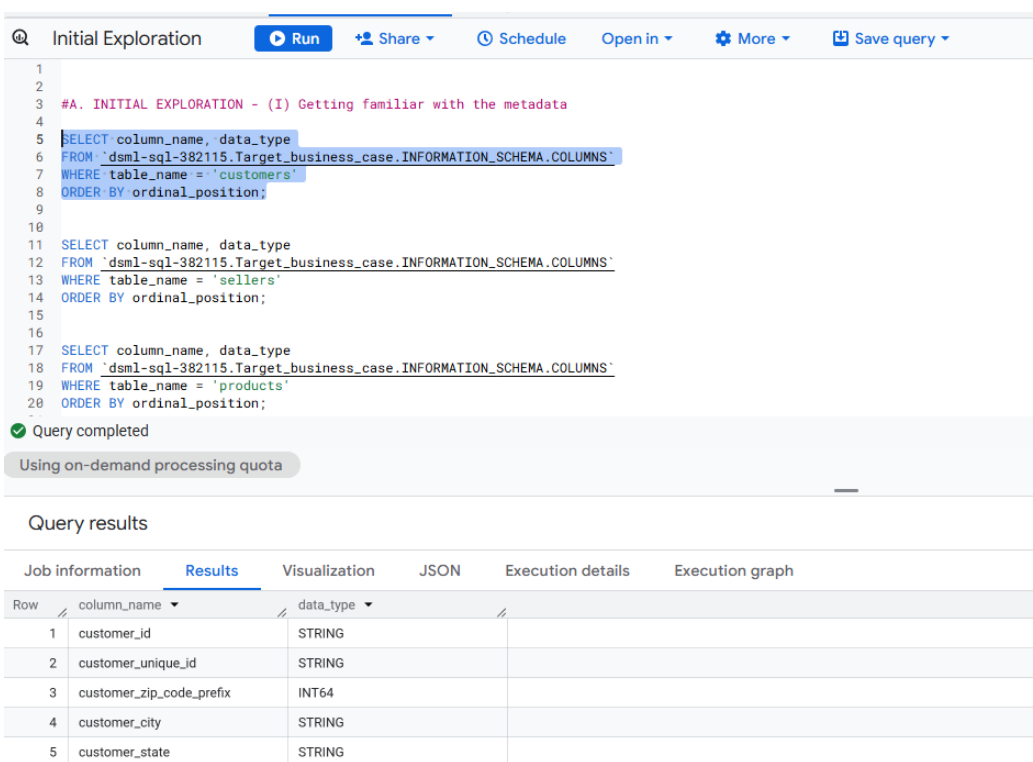
The objective of this section is to build confidence that the data is reliable and suitable for deeper trend, logistics, and financial analysis.

2. Dataset Structure Validation

The first step involved checking the schema and data types of important tables such as:

- customers
- sellers
- products

This ensures that each column is stored in the correct format for joins, filtering, and calculations.



3. Order Timeline Coverage

To understand the historical range of available transactions, the minimum and maximum purchase timestamps were analyzed.

Target_... ase | *Initial E... ion

Initial Exploration | Run | Share | Schedule | Open in | More | Save query

```
#A. INITIAL EXPLORATION - (II) Checking the time range between which the orders were placed to understand the dataset coverage duration

SELECT MIN(order_purchase_timestamp) AS first_order_date, MAX(order_purchase_timestamp) AS last_order_date
FROM `dsml-sql-382115.Target_business_case.orders`;
```

This script will process 80.76 MB when run.

Using on-demand processing quota

Query results

Job information | Results | Visualization | JSON | Execution details | Execution graph

Row	first_order_date	last_order_date
1	2016-09-04 21:15:19 UTC	2018-10-17 17:30:18 UTC

4. Geographic Reach of Customers

To measure market penetration, the number of unique cities and states from which customers placed orders was analyzed.

Target_... ase | *Initial E... ion

Initial Exploration | Run | Share | Schedule | Open in | More | Save query

```
#A. INITIAL EXPLORATION - (III) Checking the number of cities and states where customers have placed orders

SELECT count(DISTINCT c.customer_city) as total_customer_cities, count(DISTINCT c.customer_state) as total_customer_states
FROM `dsml-sql-382115.Target_business_case.orders` o
JOIN `dsml-sql-382115.Target_business_case.customers` c
ON o.customer_id = c.customer_id;
```

Query completed

Using on-demand processing quota

Query results

Job information | Results | Visualization | JSON | Execution details | Execution graph

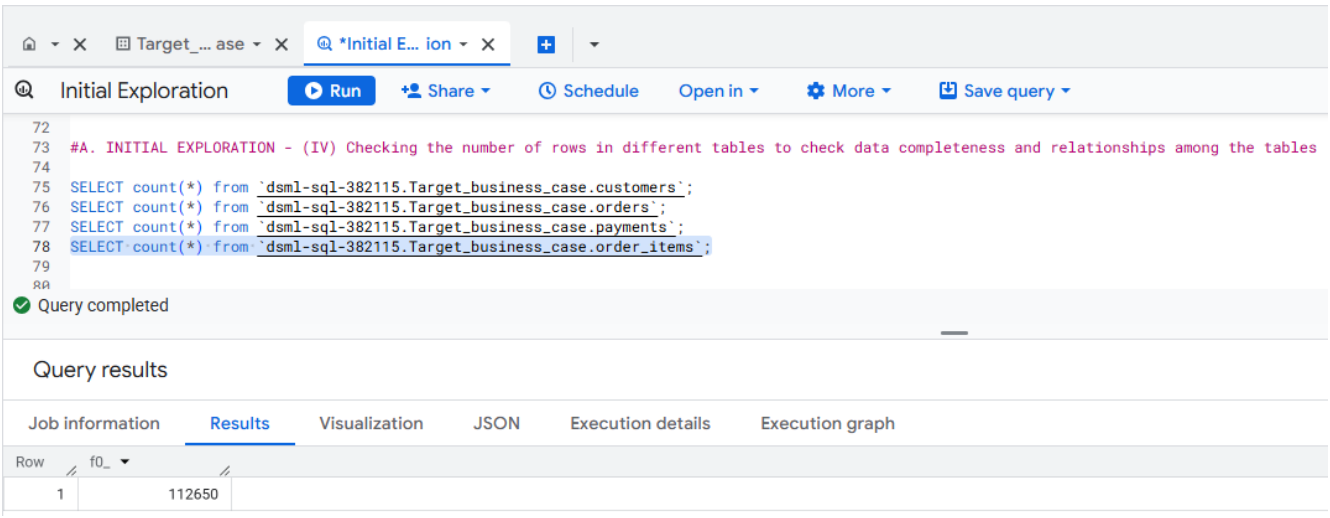
Row	total_customer_cities	total_customer_states
1	4119	27

5. Table Volume Analysis

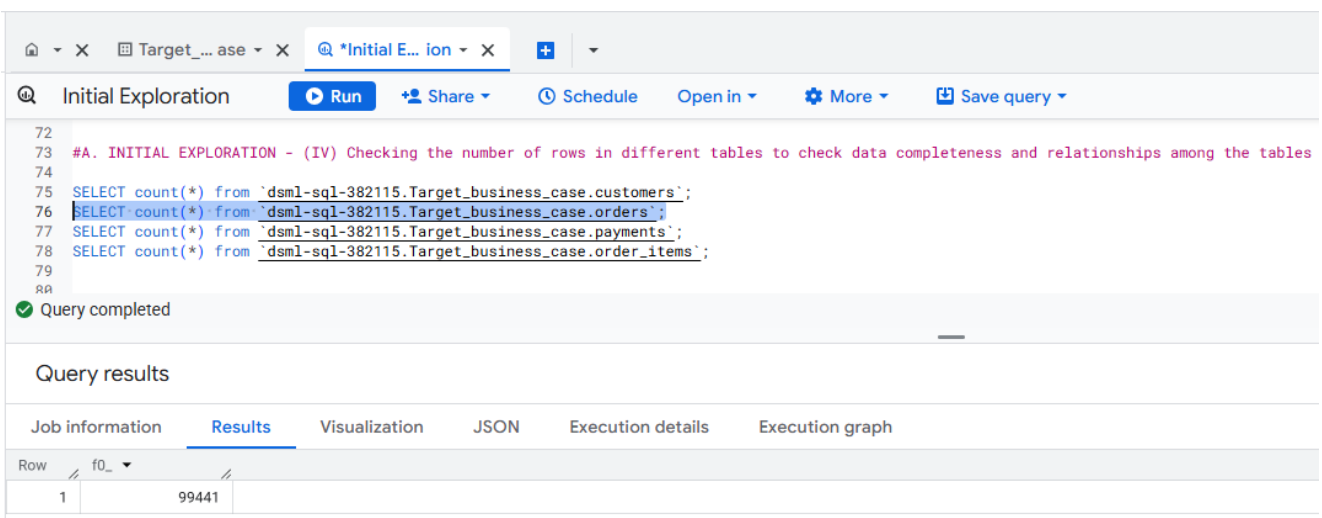
The number of rows in major transactional tables was checked to understand business scale and relationships.

Table Name	Rows
customers	99,441
orders	99,441
payments	103,886
order_items	112,650

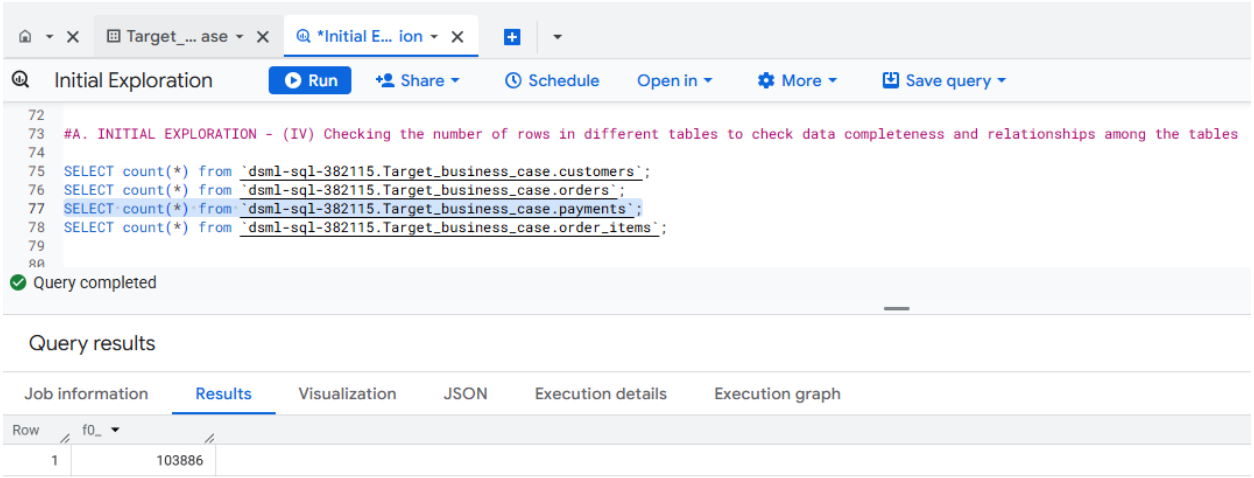
Customers table



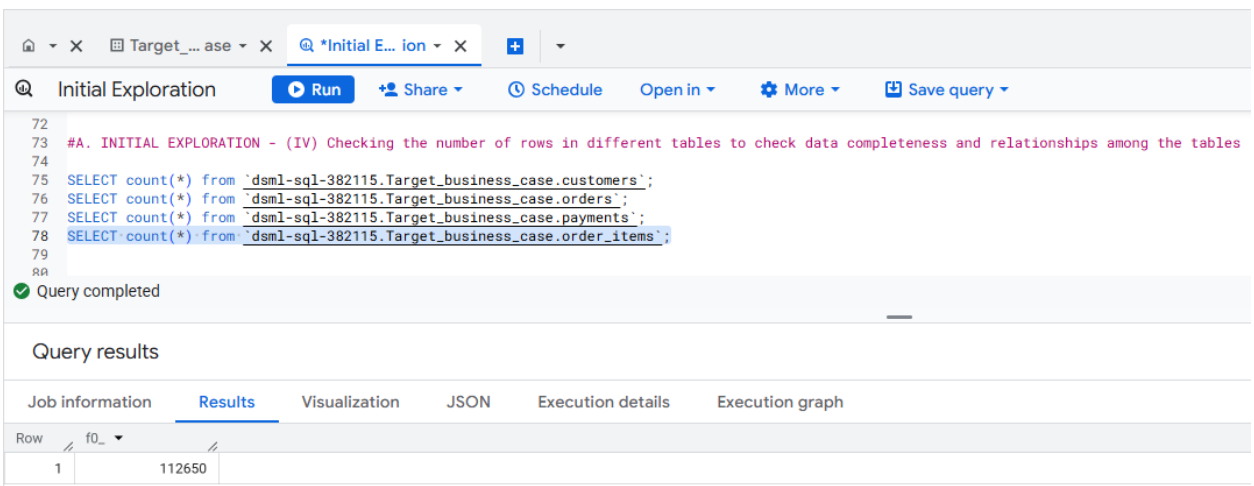
Orders table



Payments table



Order items table



Interpretation:

Customers = Orders (99,441)

Indicates that the dataset maps one order record per customer order transaction.

Payments > Orders

Some orders used:

- multiple payment attempts
- split transactions
- installment-based methods

Order Items > Orders → Many orders contain multiple products, showing basket purchases.

6. Missing Delivery Data Check

To identify cancelled, pending, or undelivered orders, null values in delivery dates were analyzed.

Interpretation:

Approximately **2.98% of total orders** were not delivered or had incomplete delivery records.

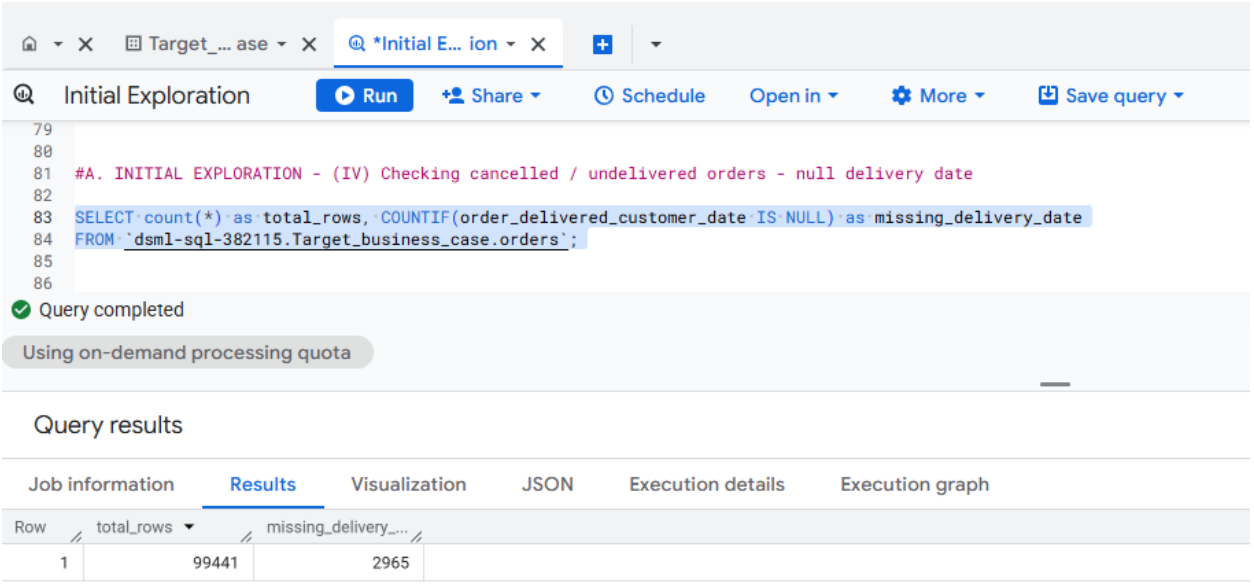
Metric	Value
Total Orders	99,441
Missing Delivery Date	2,965

Possible Reasons:

- Order cancellation
- Return initiated before delivery
- Logistics failure
- In-progress shipment

Business Impact: Undelivered orders may affect:

- customer trust
- refund cost
- operational efficiency



7. Primary Key Uniqueness Validation

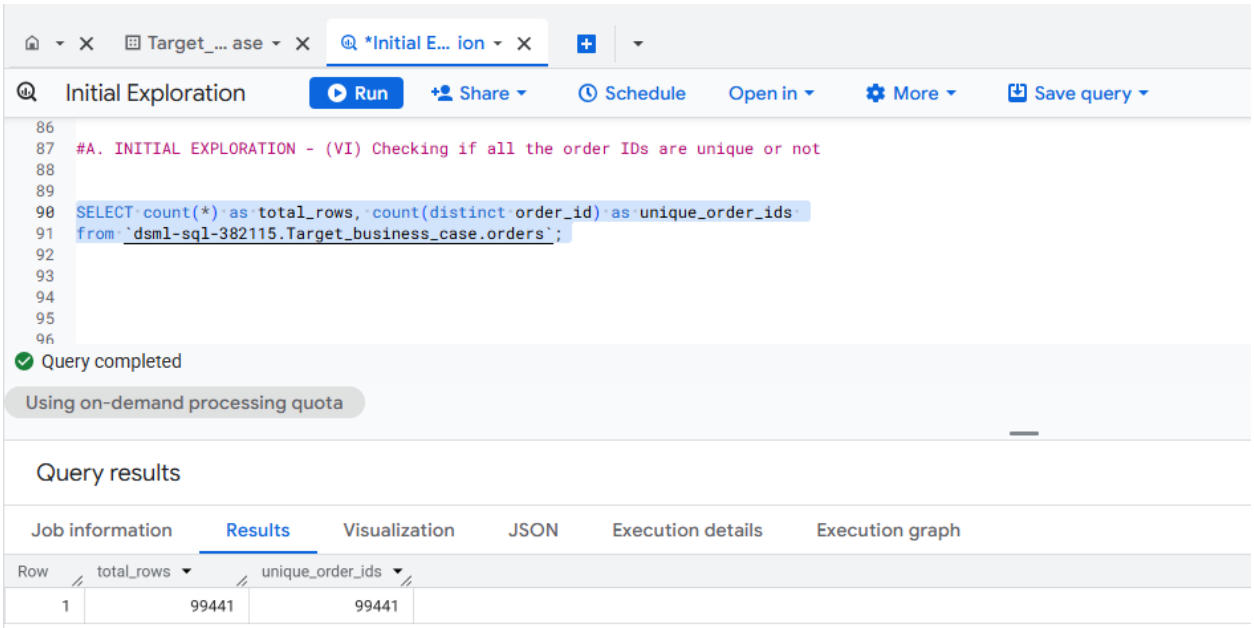
To verify data integrity, order IDs were tested for uniqueness.

Metric	Value
Total Rows	99,441
Unique Order IDs	99,441

Insight:

All order IDs are unique, confirming:

- no duplicate transactions
- clean order table
- reliable joins with payment/order items tables



8. Key Insights from initial exploration

1. Dataset is clean, structured, and analytics-ready.
2. Covers 2 years of e-commerce business activity.
3. Target has nationwide customer presence across Brazil.
4. Order volume indicates large-scale operations.
5. Multiple payment patterns exist.
6. Multi-product basket purchases are common.
7. Small percentage of orders were undelivered.
8. No duplicate order IDs found.

B. In-depth Exploration

1. Introduction

After validating the dataset structure in Section A, the next step is to analyze customer purchasing behavior and e-commerce demand patterns over time.

This section focuses on:

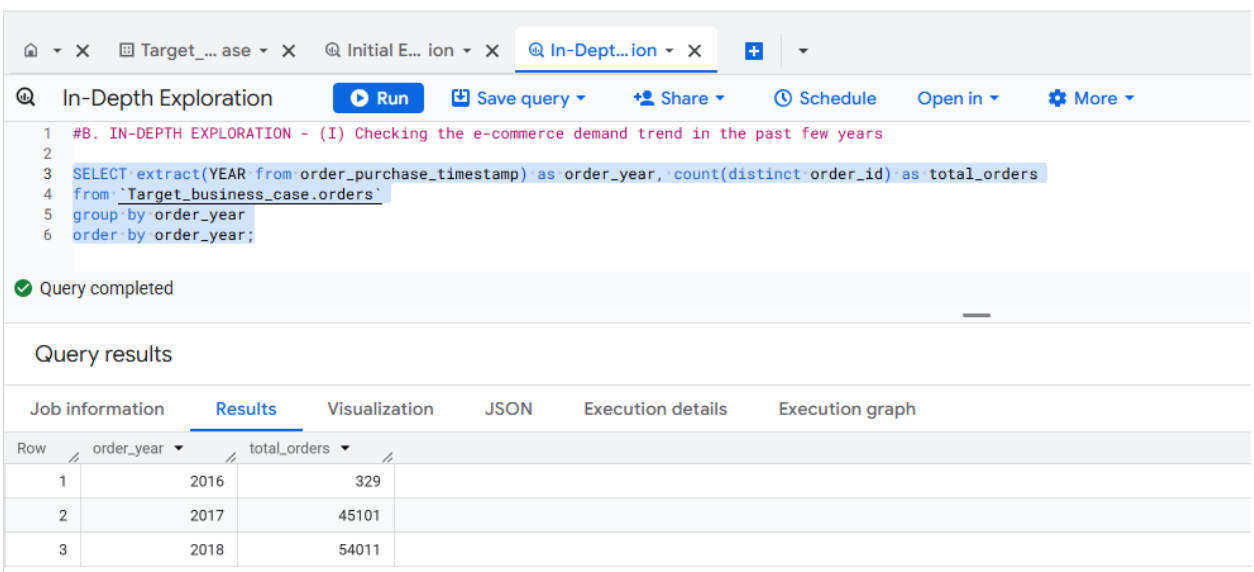
- Growth trend in orders over years
- Monthly seasonality in purchases
- Preferred time of day for placing orders

These insights help businesses forecast demand, optimize campaigns, and improve operational planning.

2. Year-wise Growth Trend in Orders

To determine whether e-commerce demand is increasing, total orders were grouped by purchase year.

Year	Total Orders
2016	329
2017	45,101
2018	54,011



3. Monthly Seasonality in Orders

Orders were analyzed month-wise to identify recurring peaks and low-demand periods.

Key Insights:

Highest Order Months

Top performing months:

1. August – 10,843
2. May – 10,573
3. July – 10,318

Possible Reasons:

- mid-year shopping cycles
- promotions
- seasonal purchasing demand

Lowest Order Months

1. September – 4,305
2. October – 4,959

These months may represent slower retail cycles

Target_... ase | Initial E... ion | *In-Dept... ion

In-Depth Exploration | Run | Save query | Share | Schedule | Open in | More

```
#B. IN-DEPTH EXPLORATION - (II) Checking monthly seasonality in orders

SELECT FORMAT_TIMESTAMP('%B', order_purchase_timestamp) AS order_month, count(DISTINCT order_id) AS total_orders
FROM `dsml-sql-382115.Target_business_case.orders`
group by order_month, extract(MONTH from order_purchase_timestamp)
order by extract(MONTH from order_purchase_timestamp);
```

Query completed

Using on-demand processing quota

Query results

Job information | Results | Visualization | JSON | Execution details | Execution graph

Row	order_month	total_orders
1	January	8069
2	February	8508
3	March	9893
4	April	9343
5	May	10573
6	June	9412
7	July	10318
8	August	10843
9	September	4305
10	October	4959
11	November	7544
12	December	5674

4. Time of Day Ordering Behavior

Customer orders were grouped into 4 time buckets:

```
0-6   = Dawn
7-12  = Morning
13-18 = Evening
19-23 = Night
```

Interpretation:

Customers likely shop:

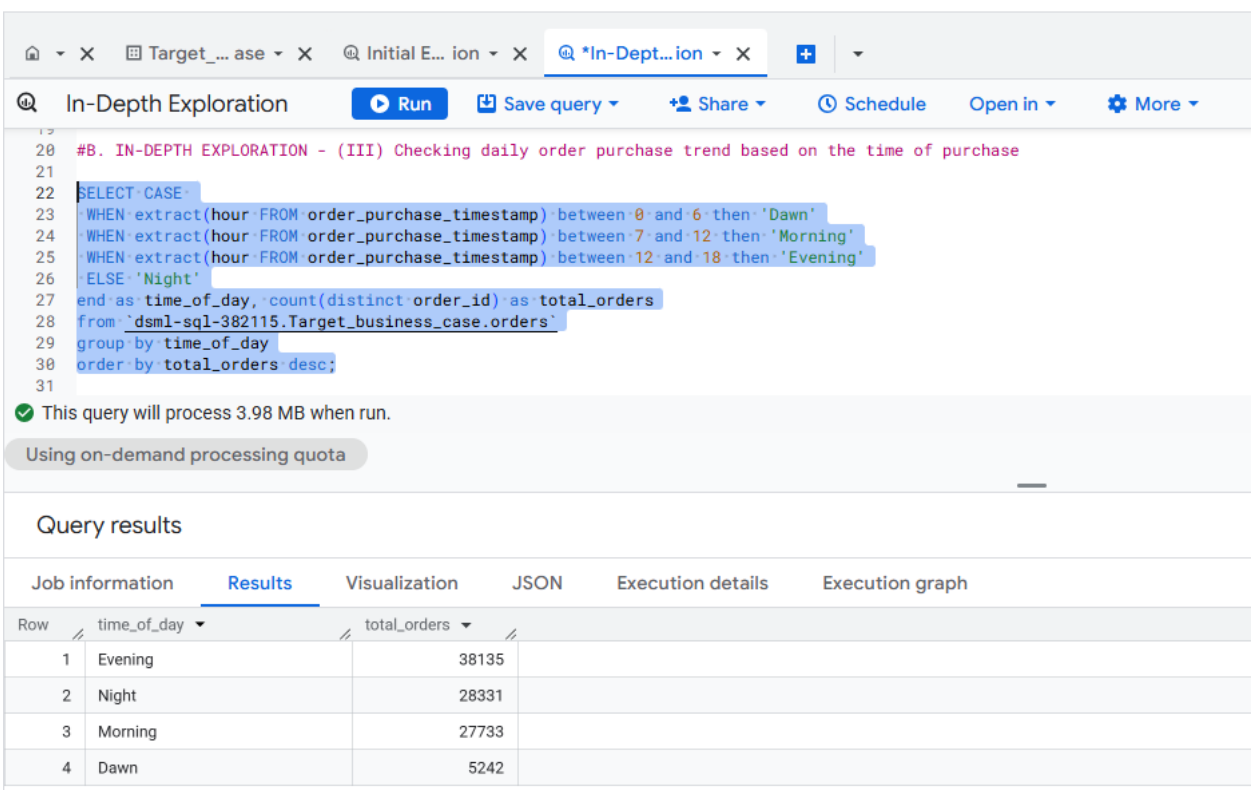
- after office hours
- during leisure time
- while browsing on mobile devices

Night Orders Also Strong

Night demand is significant, showing digital convenience behavior.

Dawn Is Lowest

Very low activity between midnight and early morning hours.



C. Evolution of E-commerce

1. Introduction

This section focuses on understanding how e-commerce orders evolved across Brazilian states over time and how customers are distributed geographically.

The objective is to identify:

- high-performing states
- emerging growth regions
- customer concentration zones
- market expansion opportunities

2. Month-on-Month Orders by State

Orders were grouped by:

- customer state
- purchase month

Target_... ase | Initial E... ion | In-Dept... ion | *E-com... sis

E-commerce analysis | Run | Save query | Share | Schedule | Open in | More

```
#C. Checking month on month number of orders placed in each state

SELECT c.customer_state, FORMAT_TIMESTAMP('%Y-%m', o.order_purchase_timestamp) as year_month, COUNT(DISTINCT o.order_id) as total_orders
from `dsml-sql-382115.Target_business_case.orders` o
join `dsml-sql-382115.Target_business_case.customers` c
on o.customer_id = c.customer_id
group by c.customer_state, year_month
order by c.customer_state, year_month;
```

This query will process 10.81 MB when run.

11	AC	2017-11	5
12	AC	2017-12	5
13	AC	2018-01	6

Results per page: 50 | 1 – 50 of 565

3. Customer Distribution Across States

Customers were grouped using customer_unique_id to measure real unique buyers from each state.

E-commerce analysis

```
#C. E-commerce analysis - (II) Checking customer distribution across all states

SELECT customer_state, count(distinct customer_unique_id) as total_customers
from `dsml-sql-382115.Target_business_case.customers`
group by customer_state
order by total_customers desc;
```

Query completed

Query results

D.Impact on economy

1. Introduction

This section evaluates how e-commerce contributes economically through:

- growth in payment value
- state-wise revenue generation
- average order spending
- freight cost behavior

2. Percentage increase in Cost of Orders (2017 vs 2018, Jan–Aug)

Metric	Value
Sales 2017	3,669,022+
Sales 2018	8,694,733+
% Increase	136.98%

Key Insight

A **136.98% increase** in payment value indicates explosive growth in just one year.

Target_... ase | Initial E... ion | In-Dept... ion | E-com... sis | Impact ... omy

Impact on Economy — Run | Save query | Share | Schedule | Open in | More

```
#D. Impact on economy - (I) % Increase in cost of orders from 2017 to 2018 (Jan to Aug only)

with yearly_sales as (
  select extract(YEAR from o.order_purchase_timestamp) as order_year,
  sum(p.payment_value) as total_sales
  from `Target_business_case.orders` o JOIN `Target_business_case.payments` p
  on o.order_id = p.order_id
  where extract(MONTH from o.order_purchase_timestamp) between 1 and 8
  and extract(YEAR from o.order_purchase_timestamp) in (2017,2018)
  group by order_year
)
SELECT max(case when order_year=2017 then total_sales end) as sales_2017,
       max(case when order_year=2018 then total_sales end) as sales_2018,
       round((max(case when order_year=2018 then total_sales end) - max(case when order_year=2017 then total_sales end))/max(case when order_year=2017 then total_sales end) * 100,2) as percentage_increase
from yearly_sales
```

```
#D. Impact on economy - (II) - Calculating total and average order value for every state

select c.customer_state,round(sum(p.payment_value), 2) as total_order_value, round(avg(p.payment_value), 2) as avg_order_value
from `dsml-sql-382115.Target_business_case.orders` o
join `dsml-sql-382115.Target_business_case.customers` c
on o.customer_id = c.customer_id
join `dsml-sql-382115.Target_business_case.payments` p
on o.order_id = p.order_id
group by c.customer_state
order by total_order_value desc;
```

This script will process 22.36 MB when run.

Using on-demand processing quota

Query results

Job information | Results | Visualization | JSON | Execution details | Execution graph

Row	customer_state	total_order_value	avg_order_value
1	SP	5998226.96	137.5
2	RJ	2144379.69	158.53
3	MG	1872257.26	154.71
4	RS	890898.54	157.18
5	PR	811156.38	154.15
6	SC	623086.43	165.98
7	BA	616645.82	170.82
8	DF	355141.08	161.13
9	GO	350092.31	165.76
10	ES	325967.55	154.71
11	PE	324850.44	187.99
12	CE	279464.03	199.9

Key Insights

SP Generates Highest Revenue - Driven by its massive customer base.

RJ & MG Have Higher Average Spend - Though smaller than SP in total revenue, customers spend more per order than SP.

Meaning: Potential premium customer segments.

Some Smaller States Show Strong AOV - PE = 187.99 and CE = 199.90

This suggests selective premium demand outside top metros.

4. Total & Average Freight Value by State

Top States from Output:

State	Total Freight	Avg Freight
SP	718,723.07	15.15
RJ	305,589.31	20.96
MG	270,853.46	20.63
BA	100,156.68	26.36
PE	59,449.66	32.92

Key Insights

SP Has Highest Total Freight but Lowest Average

This means:

- huge order volume
- efficient logistics network
- economies of scale

PE and BA Show Higher Average Freight

Likely due to:

- longer shipping distances
- lower warehouse density
- regional transport inefficiencies

Target_... ase | Initial E... ion | In-Dept... ion | E-com... sis | *Impact ... omy

E. Sales, freight and delivery analysis

1. Introduction

This section focuses on operational efficiency by analyzing:

- actual delivery time
- promised vs actual delivery performance
- freight cost differences across states
- fastest and slowest delivery regions

These metrics directly impact:

- customer satisfaction
- repeat purchase rate
- logistics cost & profitability

2. Delivery Time vs Estimated Delivery Time

For each order, two metrics were calculated:

time_to_deliver_days = delivery date - purchase date
diff_estimated_delivery_days = delivery date - estimated date

Interpretation:

- Negative value = delivered early
- Positive value = delivered late
- Zero = on time

Time, sales, freight analysis

```
#E. Analysis on sales, freight and delivery times -
#(I) - Checking actual delivery time vs difference in estimated and actual delivery time

select order_id, order_purchase_timestamp, order_delivered_customer_date, order_estimated_delivery_date,
date_diff(date(order_delivered_customer_date),date(order_purchase_timestamp),day) as time_to_deliver_days,
date_diff(date(order_delivered_customer_date),date(order_estimated_delivery_date),day) as diff_estimated_delivery_days
from `dsml-sql-382115.Target_business_case.orders`
where order_delivered_customer_date is not null;
```

This query will process 5.48 MB when run.

Rank	State	Avg Freight
1	RR	42.98
2	PB	42.72
3	RO	41.07
4	AC	40.07
5	PI	39.15

Business Meaning

These states likely face:

- long delivery distances
- weaker fulfillment network
- lower shipment density
- higher courier charges

Target_... ase | Initial E... ion | In-Dept...ion | E-com... sis | Impact ... omy

1	SP	15.15
2	PR	20.53
3	MG	20.63
4	RJ	20.96
5	DF	21.04

Insight

Large developed states benefit from:

- better infrastructure
- dense demand clusters
- shorter average shipping distance
- stronger courier competition

Query results | Chat | Save results

Job information | Results | Visualization | JSON | Execution details | Execution graph

Row	customer_state	avg_delivery_days
1	RR	29.34
2	AP	27.18
3	AM	26.36
4	AL	24.5
5	PA	23.73

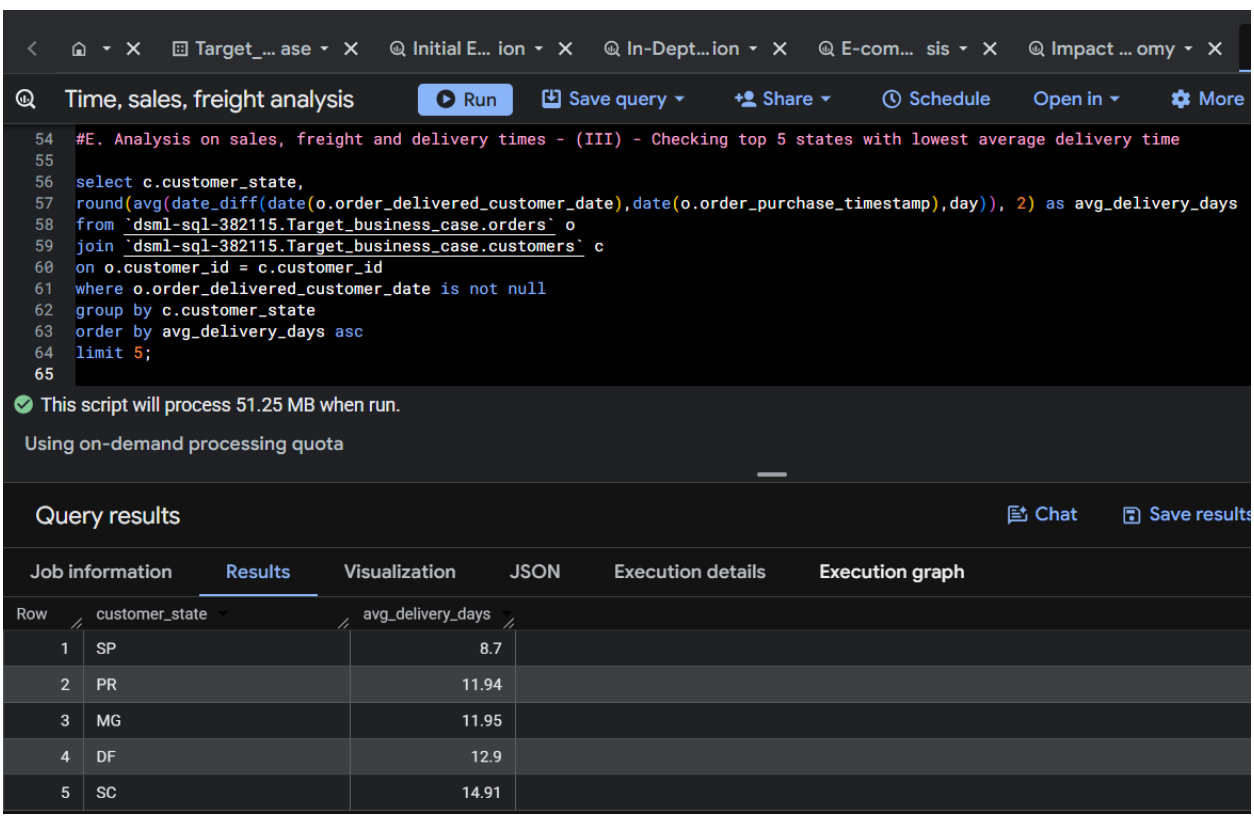
6. Top 5 States with Lowest Average Delivery Time

Results:

Rank	State	Avg Delivery Days
1	SP	8.70
2	PR	11.94
3	MG	11.95
4	DF	12.90
5	SC	14.91

Insight

These states demonstrate strong logistics efficiency and can serve as operational benchmarks.



7. States Delivered Faster Than Estimated

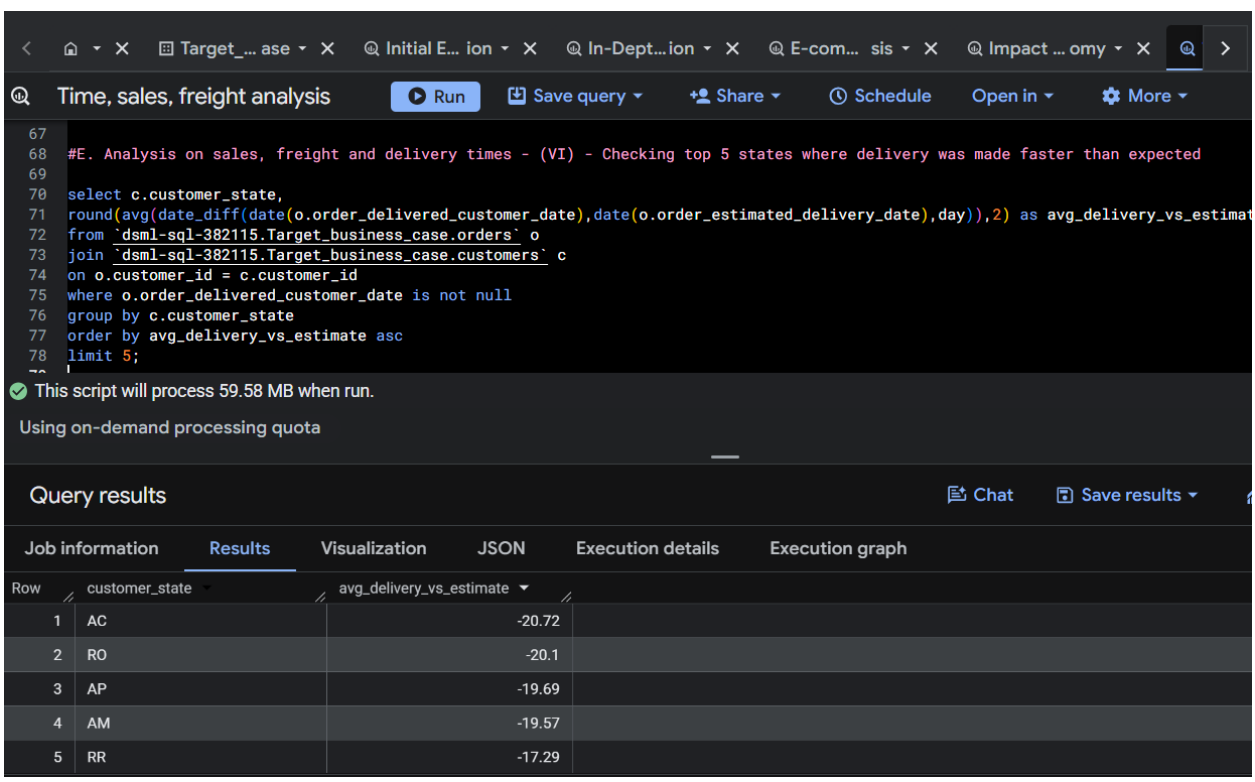
Results:

Rank	State	Avg Days Earlier
1	AC	-20.72
2	RO	-20.10
3	AP	-19.69
4	AM	-19.57
5	RR	-17.29

Interpretation

Although remote states have longer delivery times, estimated dates were conservatively set, leading to earlier-than-promised deliveries.

Strategic Meaning: Expectation management is strong in these states.



F. Payment Analysis

1. Introduction

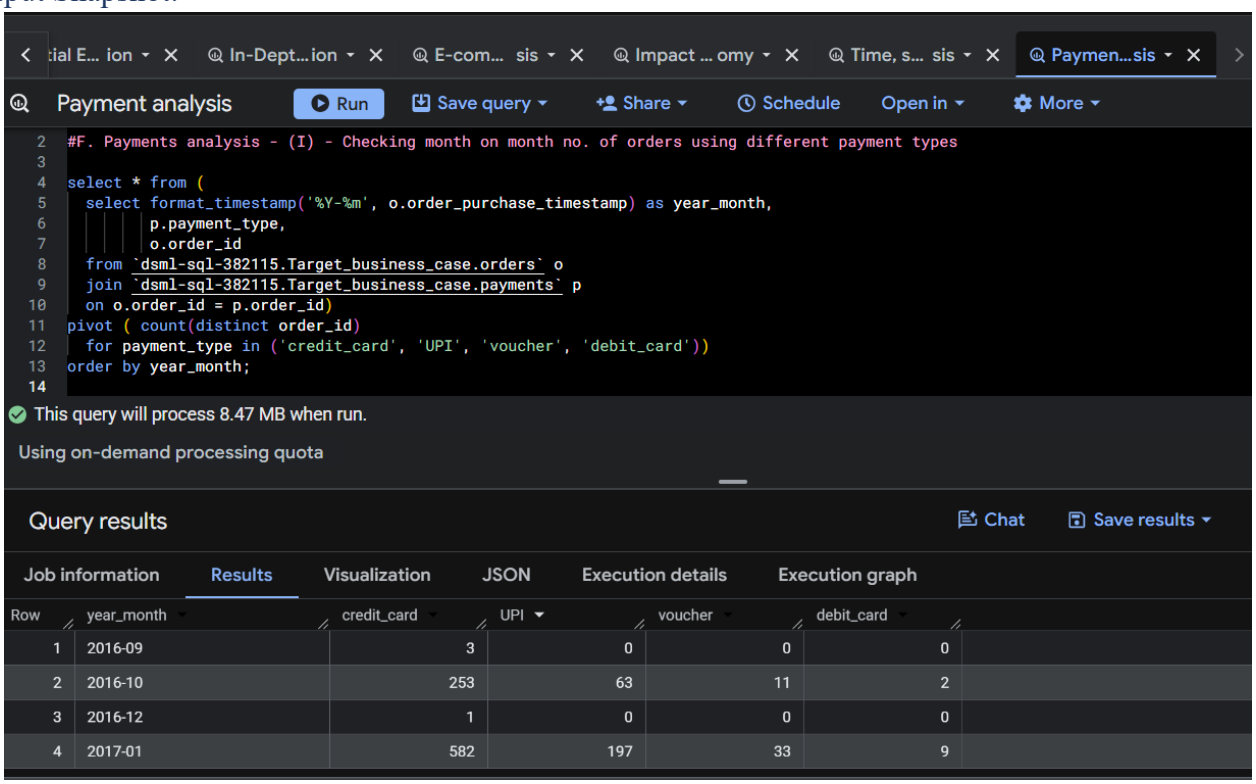
This section evaluates customer payment behavior through:

- month-on-month payment type usage
- installment adoption trends

These insights help improve checkout conversion and payment partnerships.

2. Month-on-Month Orders by Payment Type

Output Snapshot:



Row	year_month	credit_card	UPI	voucher	debit_card
1	2016-09	3	0	0	0
2	2016-10	253	63	11	2
3	2016-12	1	0	0	0
4	2017-01	582	197	33	9

Key Insights - Credit Card Dominates - Credit card consistently has highest usage.

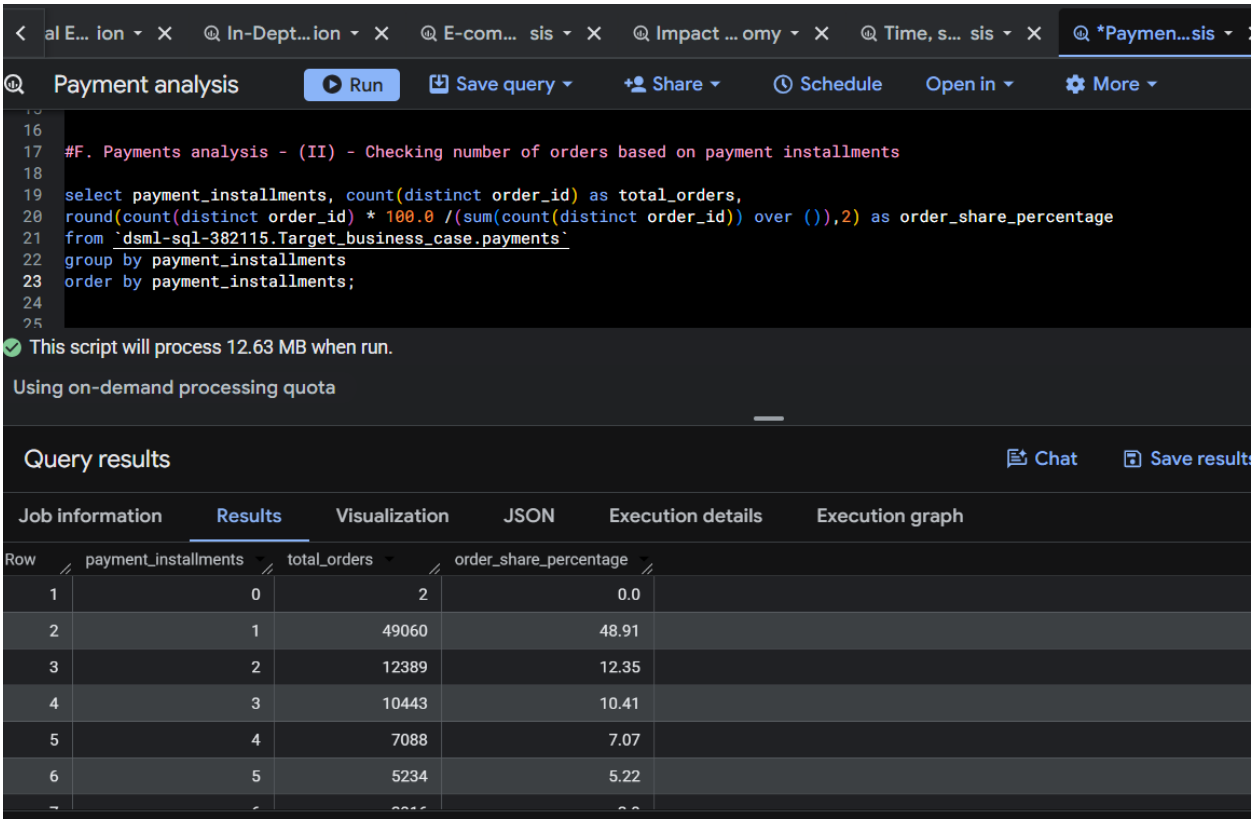
Meaning: 1. preferred payment method, **2.** higher trust in card payments, **3.** potential for EMI conversion

UPI / Alternative Methods Growing

Secondary methods show meaningful adoption.

3. Orders Based on Installments

Output Snapshot:



Row	payment_installments	total_orders	order_share_percentage
1	0	2	0.0
2	1	49060	48.91
3	2	12389	12.35
4	3	10443	10.41
5	4	7088	7.07

Key Insights

Nearly 49% Full Payment

Most customers prefer single-payment checkout.

Strong EMI Usage

Remaining users actively use installments, indicating financing demand.

Meaning:

- affordability matters
- EMI can drive bigger basket size
- financing increases conversions

G. Actionable insights and business recommendations

1. Strengthen Core Markets (SP, RJ, MG)

These states contribute the highest share of customers and revenue. Allocate more marketing budget, faster delivery promises, and loyalty programs here.

2. Build Regional Warehouses in High Freight States

States like RR, PB, RO, AC, PI have high freight costs. Opening local fulfillment centers can reduce shipping charges and delivery time.

3. Improve Delivery Performance in Slow States

States such as RR, AP, AM, AL, PA have the longest average delivery times. Partner with better courier networks and optimize routes.

4. Replicate São Paulo Logistics Model

SP has the lowest freight and fastest delivery. Study its supply chain model and apply similar strategies in other states.

5. Launch Evening-Focused Marketing Campaigns

Most orders are placed during evening hours. Run ads, push notifications, and flash sales between 6 PM – 11 PM.

6. Use Seasonal Demand Forecasting

May to August show highest order volume. Increase inventory, warehouse staffing, and marketing spend during these months.

7. Boost Sales in Weak Months

September and October had lower orders. Launch festive sales, cashback campaigns, and discounts in these months.

8. Promote Credit Card Offers

Credit card is the dominant payment mode. Partner with banks for cashback, rewards, and instant discount offers.

9. Expand No-Cost EMI / Installment Options

A large share of customers prefer installments. Offer no-cost EMI to increase conversion on high-ticket products.

10. Create Premium Product Strategy in High AOV States

States like PE and CE show high average order value. Promote premium bundles, subscriptions, and exclusive offers there.

11. Improve Customer Retention in High Revenue States

Use membership programs, faster support, and personalized recommendations in SP, RJ, MG.

12. Reduce Undelivered Orders

Around 3% of orders had missing delivery dates. Audit cancellations, failed deliveries, and refund reasons.

13. Encourage Multi-Product Basket Purchases

Order items exceed order count, meaning customers buy multiple products. Use combo deals and cross-sell recommendations.

14. Localized Pricing Strategy

Freight and spending patterns vary by state. Use state-wise free shipping thresholds and promotional pricing.

15. Expand into Emerging Smaller States

Smaller states show active customer participation. Use targeted digital campaigns to capture untapped markets.

16. Conservative ETA Strategy for Remote States

Some remote states were delivered earlier than estimated. Continue realistic ETAs to improve customer trust.

17. Optimize Last-Mile Delivery Costs

Use local courier tie-ups and pickup points in expensive delivery zones to improve margins.

18. Create Data-Driven Demand Planning Dashboard

Track orders, freight, delivery delays, and payment trends monthly in Google BigQuery / dashboards.

19. Increase Mobile Commerce Focus

Night and evening orders indicate convenience shopping. Optimize mobile app/site experience and one-click checkout.

20. Segment Marketing by Region

Urban states need premium/retention campaigns, while smaller states need awareness and acquisition campaigns.
